Goals

- Be able to edit a file using vi
- Begin to understand the “language” of configuration files
- Use alternate editors: ee, joe, pico, nano, emacs, xemacs, gedit, etc.

vi Philosophy

- It's available!
- It's available! Even in Embedded/BusyBox.
- It's has some very powerful features.
- It's ubiquitous in UNIX and Linux (`visudo`, `vipw`, `vigr`, etc.)
- Not hard after initial learning curve.
- Impress your friends and family with your arcane knowledge of computers.

Why is vi “so hard to use”?

Like all things it's not really – once you are used to how it works.

The ***critical*** vi concept:

1. vi has two modes
2. These modes are ***insert*** and ***command***

Let's see how we use these...

vi Command and Insert Modes

Swapping modes

- When you open a file in vi you are in *command mode* by default.
- If you wish to edit the file *you need to switch to insert mode first*.
- To exit *insert mode* press the ESCape key.
- If you get used to this concept you are halfway done to becoming a competent vi user.

vi Insert Mode

Two common ways to enter insert mode upon opening a file include:

- Press the “i” key to start entering text directly after your cursor.
- Press the “o” key to add a new line *below* you cursor and to start adding text on the new line.
- Remember, to exit *insert mode* press the ESCape key at any time.

vi Command Mode

Many, many commands in vi, but some of the most common and useful are:

- Press “**x**” to delete a character at a time.
- Press “**dd**” to delete the line you are on.
- Press “/”, and text to search for and press <ENTER>.
 - Press “n” to find the next occurrence of text.
 - Press “N” to find previous occurrences of text.

Saving Files, or How To Exit vi

1. In vi press the *ESCape* key to verify you are in command mode.
2. Depending on what you want to do press:
 - **:w** → write the file to disk
 - **:wq** → write the file to disk, then quit
 - **:q** → quit the file (only works if no changes)
 - **:q!** → quit and lose any changes made
 - **:w!** → override r/o file permission if you are owner or *root* and write the file to disk.
 - **:w!q** → override r/o file permission if you are owner or *root* & write the file & quit.

Speed Up Editing Config Files

1. In vi press the *ESC*ape key to verify you are in command mode.
2. To search for the first occurrence of something:
 - `/string` → press <ENTER>
 - “n” → press “n” for each following occurrence
 - “N” → press “N” for each previous occurrence
3. To replace *all* occurrences of a string in a file:
 - `:%s/old_string/new_string/g`
4. To replace *all* occurrences of a string in a file:
 - `:%s/old_string/new_string/gc`

Speed Things Up Some More!

1. In vi press the *ESCape* key to verify you are in command mode.
2. Go directly to a specific line number
 - `:NN` → press `<ENTER>`. If `NN=100`, go to line 100
3. Go to start/end of a line
 - press *Home* or press *End* on your keyboard
4. Go to top/bottom of a file:
 - press *ctrl-Home* or press *ctrl-End* on your keyboard
5. Undo the last change you made (in command mode)
 - press **“u”**

Configuration File Patterns

- The most common comment character is “#”.
- After that you'll see “/* */” or “//”.
- There are a few less common others.

Editing Configuration Files

- Some configuration files have many comments and few directives
- Others are the opposite.
- Blocks of configuration may be indicated in a programmatic manner, i.e.:

<VirtualHost *>

<SubSection>

directive

</SubSection>

</VirtualHost>

Editing Configuration Files

Another standard is to do the following:

```
## comment
```

```
## comment
```

```
# default setting=off
```

To change the default do:

```
default setting=on
```

Editing Configuration Files

Things to watch out for:

- Spaces
- Quotes and single quotes: “directive” or 'directive'
- Caps or CamelCase syntax
 - Localhost=”myhost”
 - LocalHost=”myhost”
- Line end indicator (: or ;)
- New-line or continuation character “\”.

Software Management @ Command Line

- **dpkg**

- `dpkg --get-selections, dpkg-reconfigure, dpkg-query`

- **apt**

- `apt-cache, apt-cache policy, apt-cache search apt-get, apt-get install, apt-get remove, apt-get purge, apt-get clean`

- `meta-packages (build-essentials, ubuntu-desktop)`

- **Repositories**

- Controlled by `/etc/apt/sources.list`

- **aptitude**

- `aptitude search, aptitude clean, aptitude remove, aptitude purge`

Other Editors

Not everyone uses Vi!

- ee
 - ESC brings up the editor menu
- jed
 - F10 brings up the editor menu
- joe
 - Ctrl-k-h brings up the editor menu
 - Ctrl-c aborts
- nano/pico
 - Commands shown at bottom of screen

Any Questions?
